

## **ABSTRACT**

Please delete the existing Abstract in its entirety and substitute the following:

An electrically heatable glazing panel includes a substrate and multiple electrically heatable zones, each electrically heatable zone including an electrically conductive coating layer and spaced bus bars thus defining a conductive path therebetween, with at least some of the zones delimited by at least one substantially insulating zone boundary, and where the conductive path of at least one of the electrically heatable zones changes direction at least once along its length so as to double back upon itself.
